

# MULTI-TENANCY

## WITH LARAVEL

# Marlex Ladag

Owner/Founder and IT Consultant @ RackApp

- A full-stack developer
- Focus on developing e-commerce and web applications
- I'm the owner and founder of RackApp IT Solutions.
- A Calbayog based IT Company
- We specialize in developing custom software solutions for businesses.

# What is Multi-tenancy?

In multi-tenant software architecture—also called *software multitenancy*—a single instance of a software application (and its underlying database and hardware) serves multiple tenants (or user accounts).

# Why Multi-Tenancy?

- Cost Savings
- Simplified Management
- Scalability
- Resource Efficiency
- Faster Onboarding

# Multi-Tenant Applications

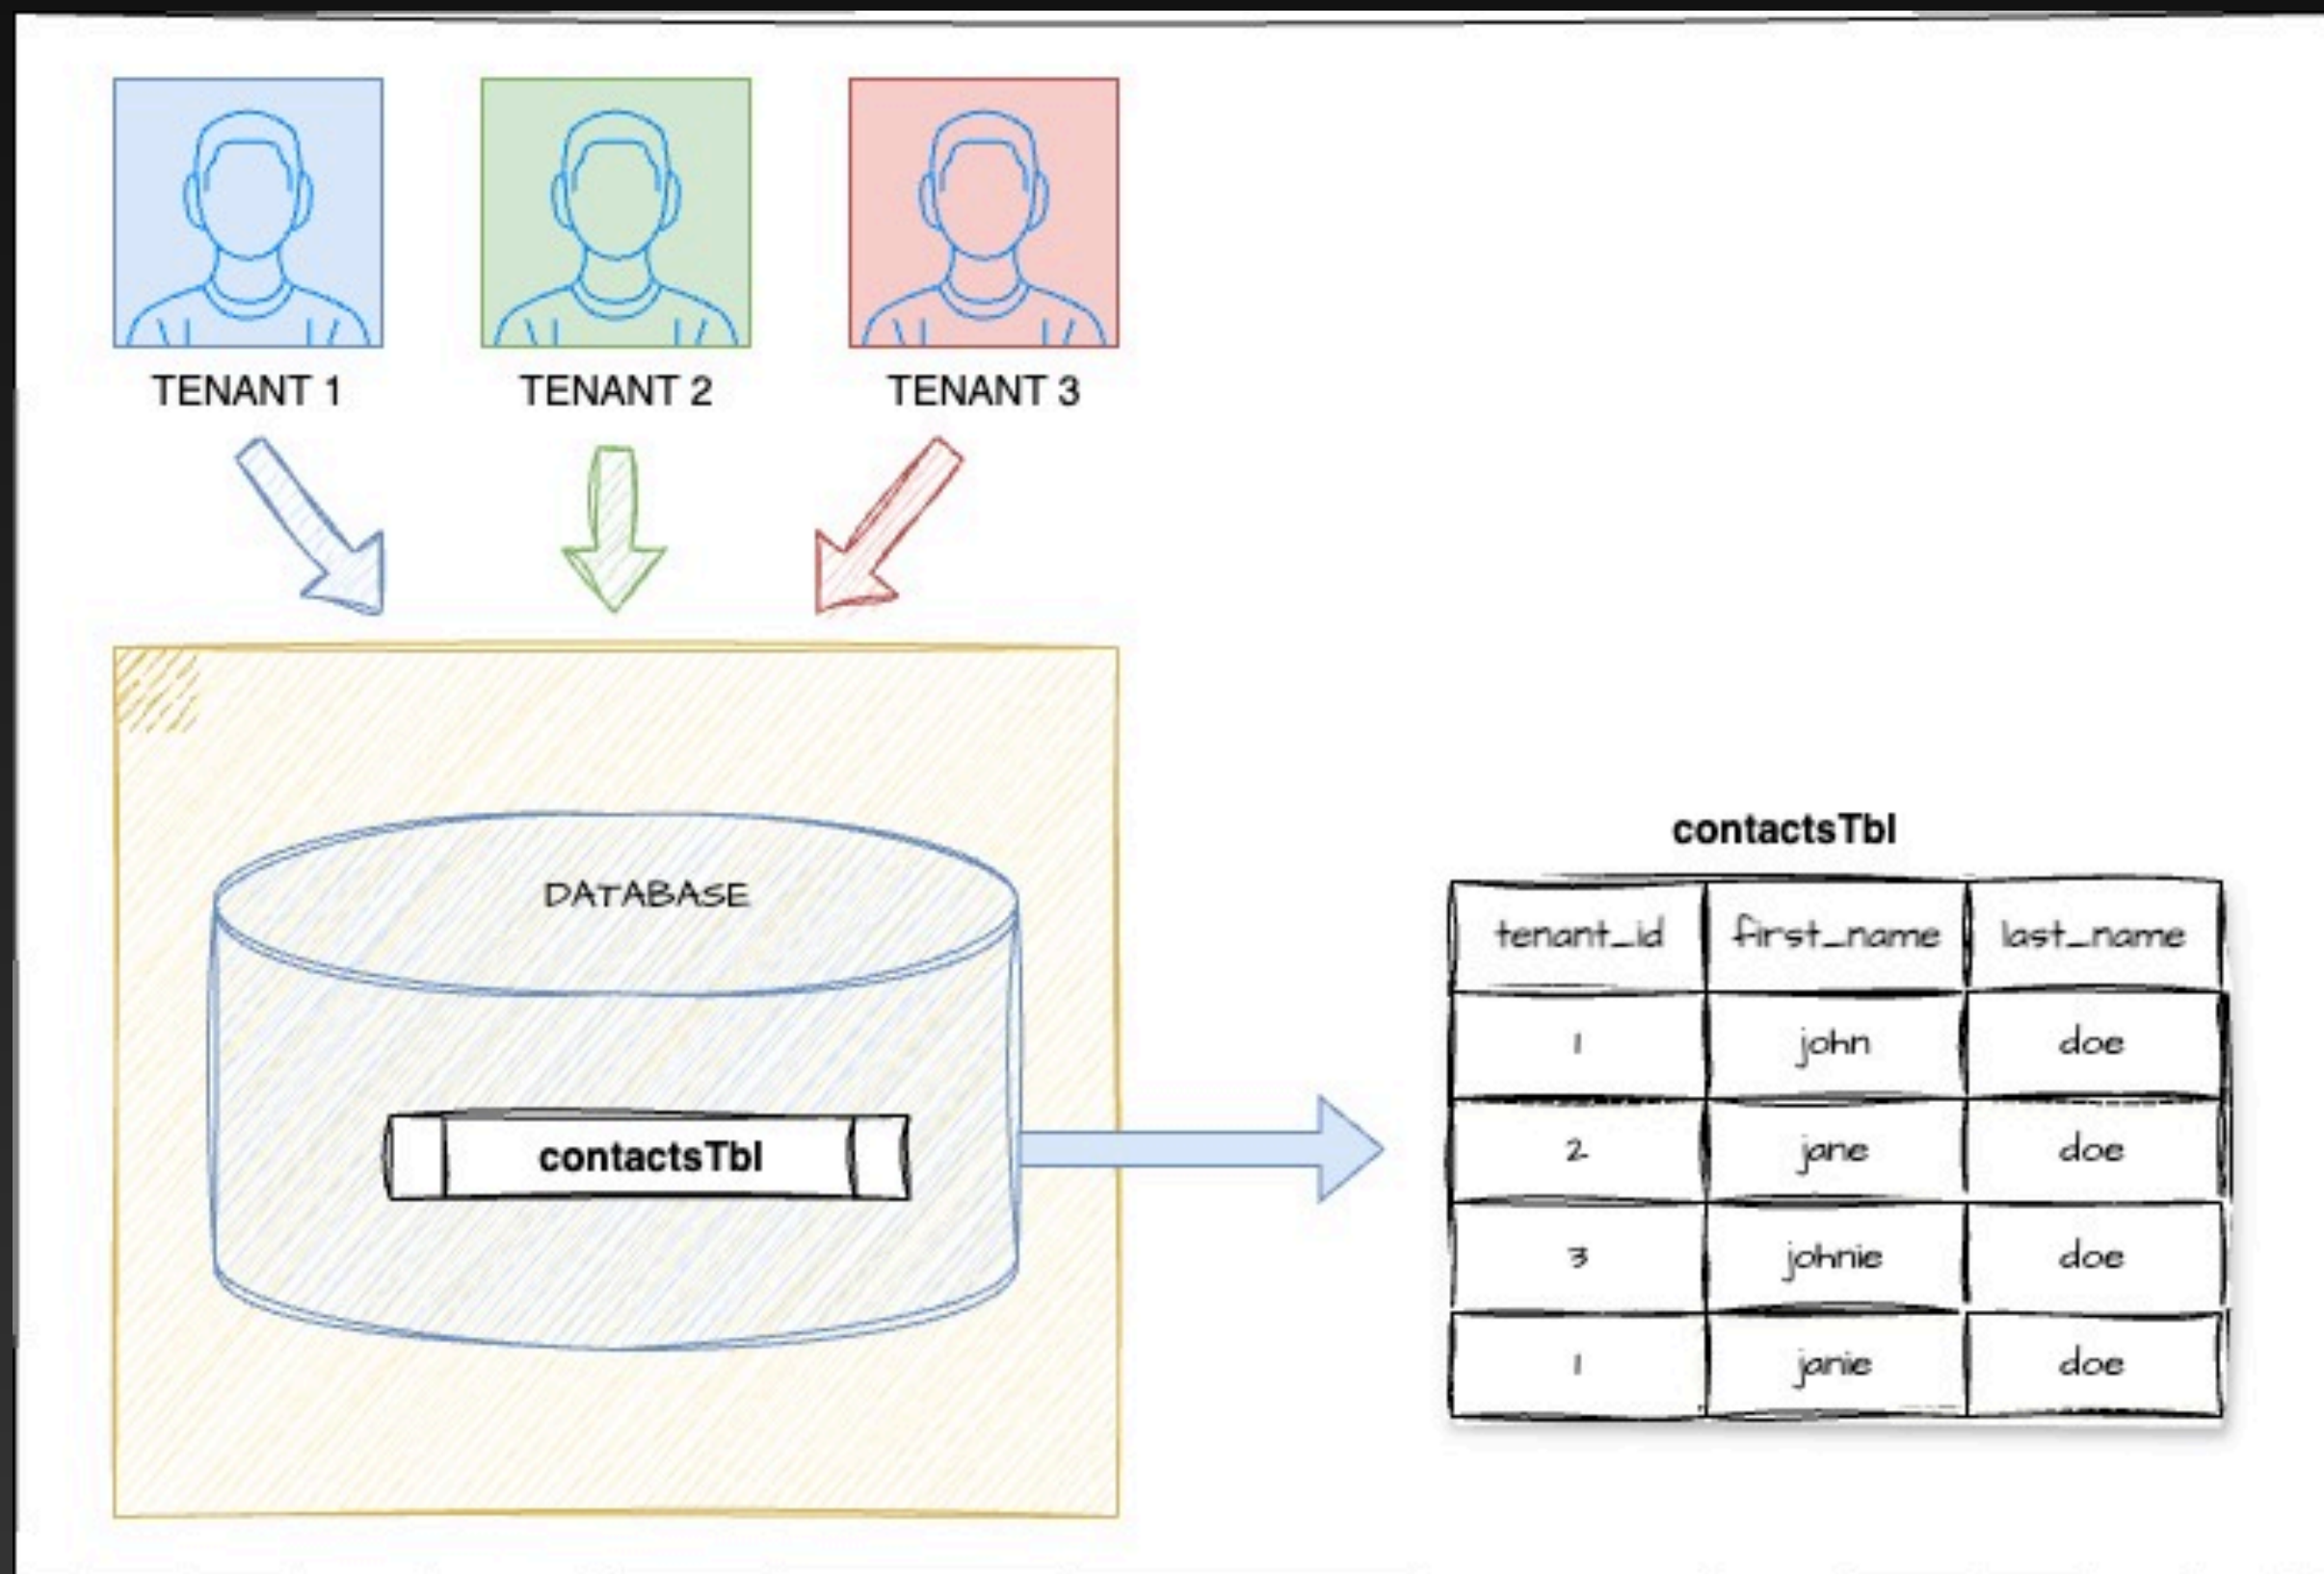

# Multi-tenancy Approaches

# Shared database - shared schema

## Multi-tenancy Approaches

### Pros:

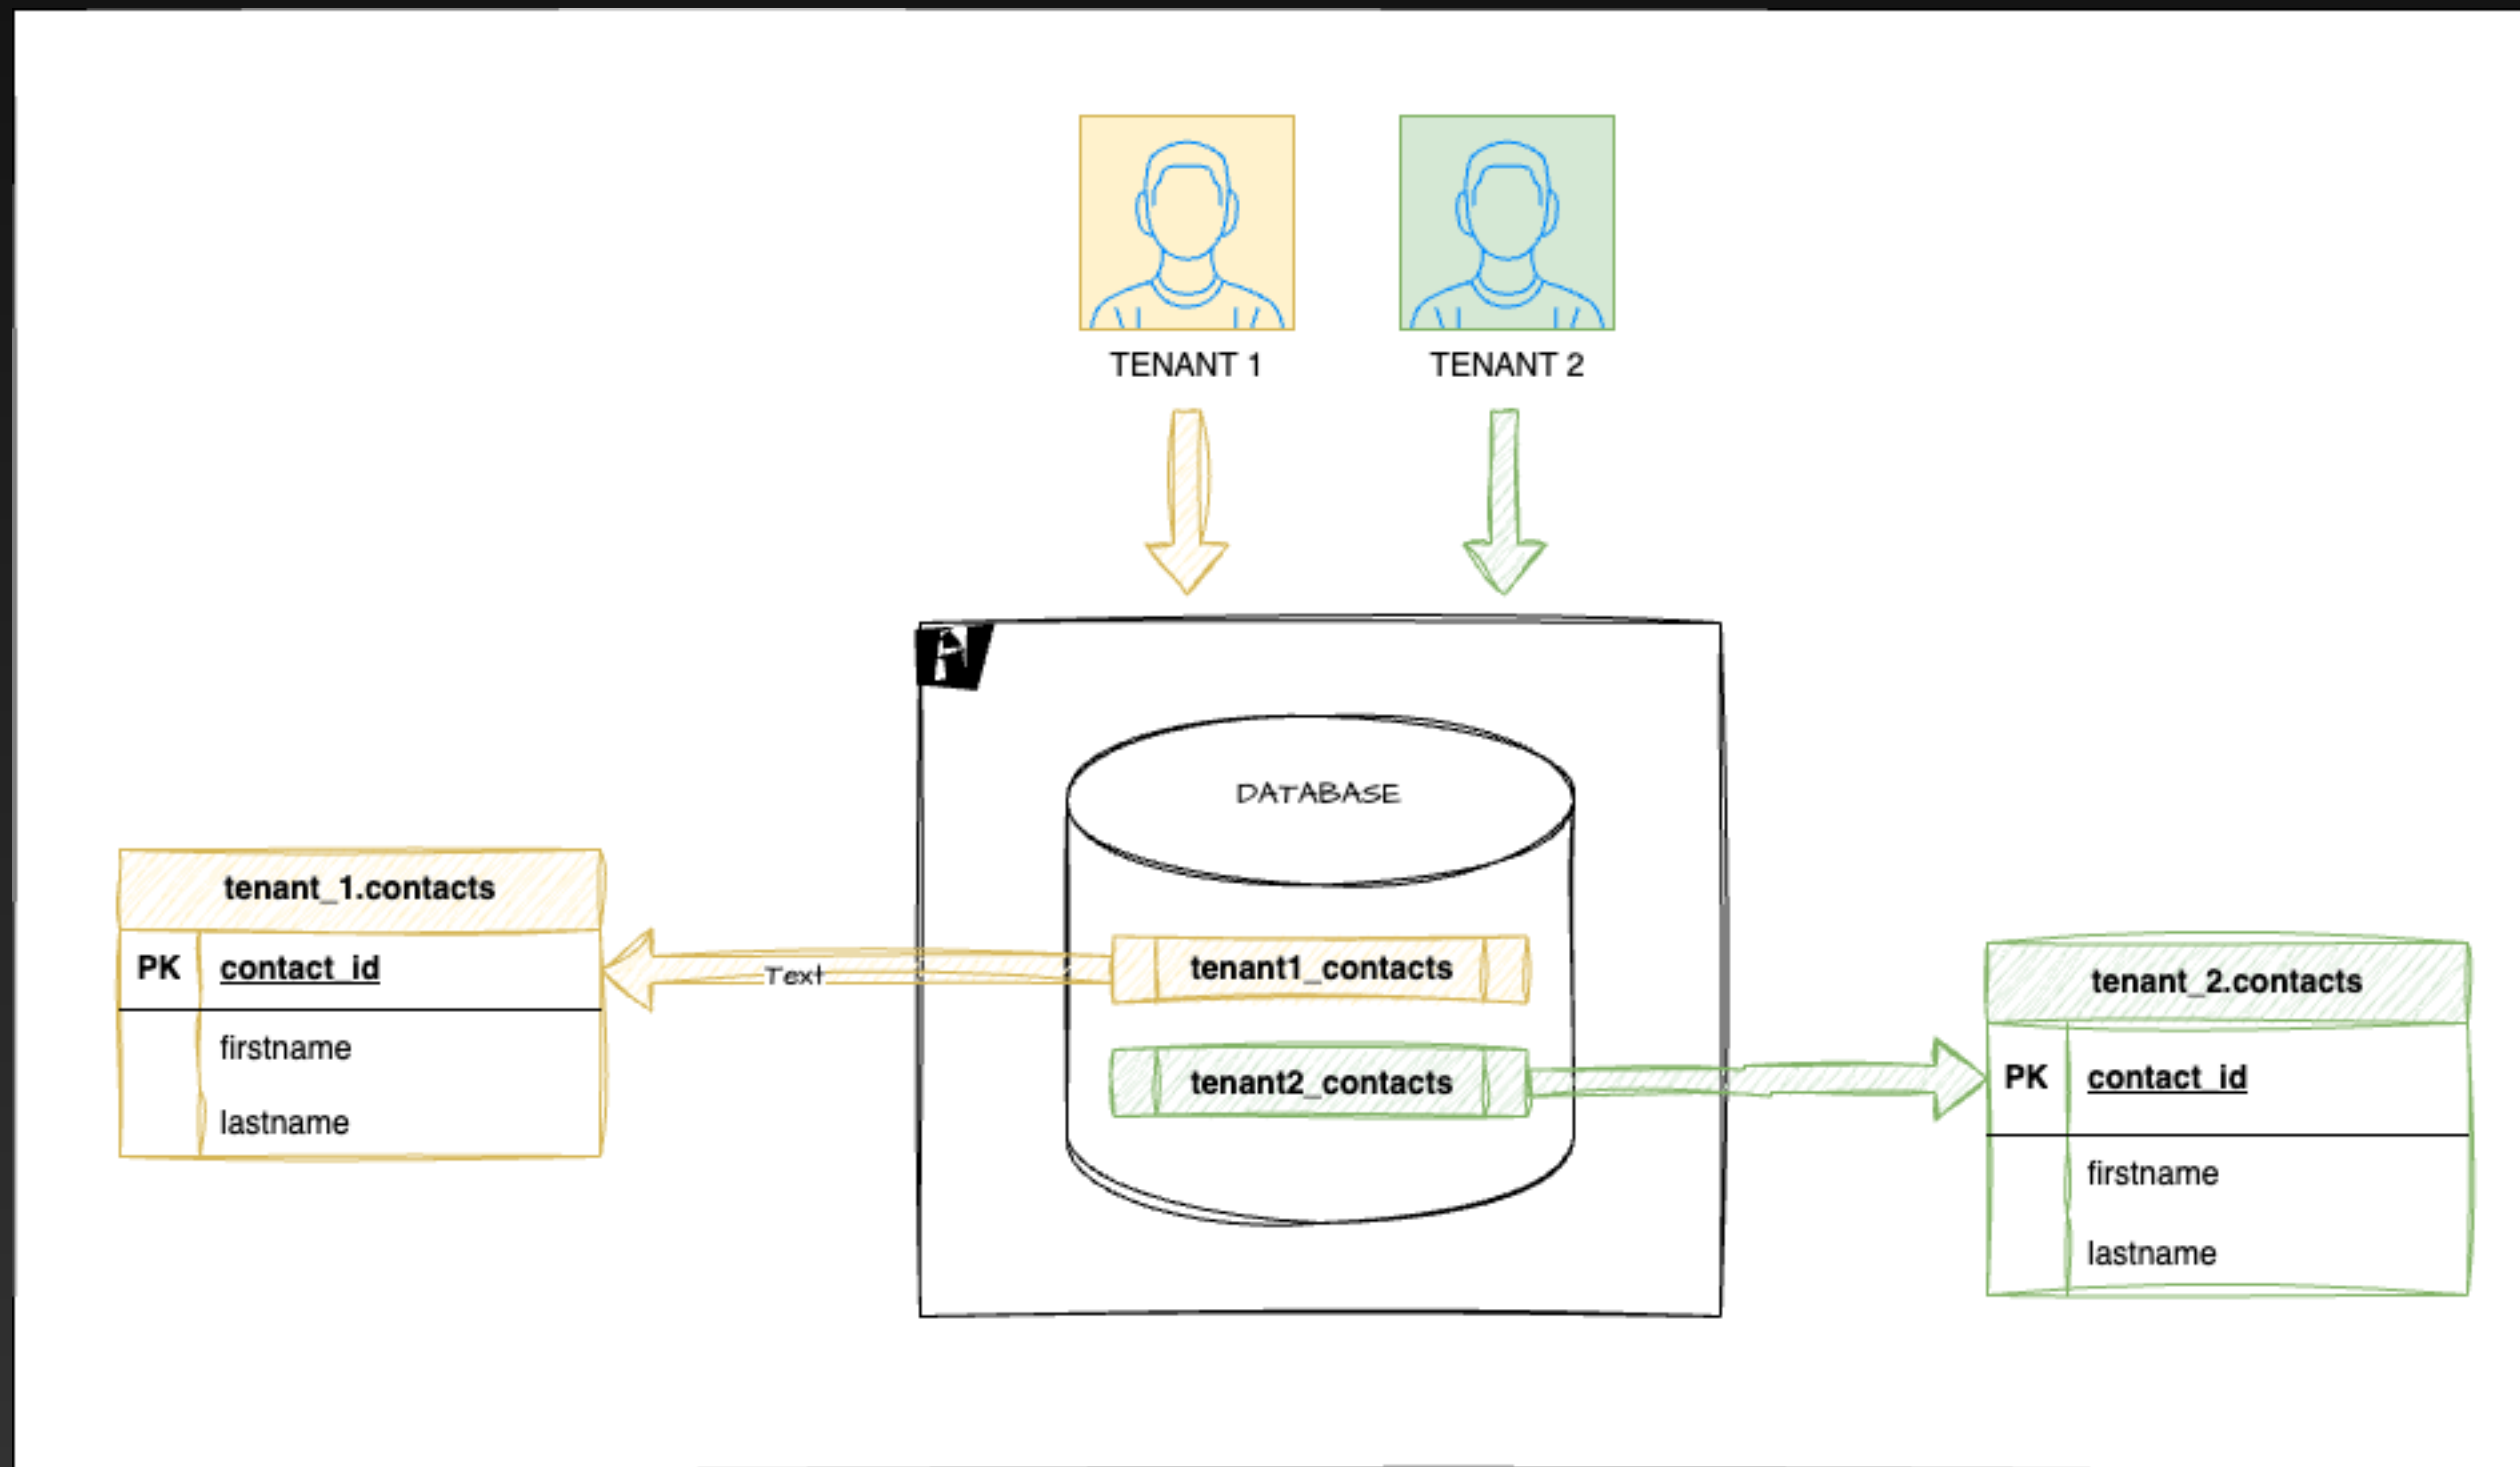

- Simplest to set up
- Most cost-effective
- Efficient resource utilization

### Cons

- Complex data isolation
- Potential performance bottlenecks
- Schema changes impact all tenants
- Less secure data separation

# Shared database - separate schemas

## Multi-tenancy Approaches

### Pros:

- Better data isolation
- Good balance of cost and isolation

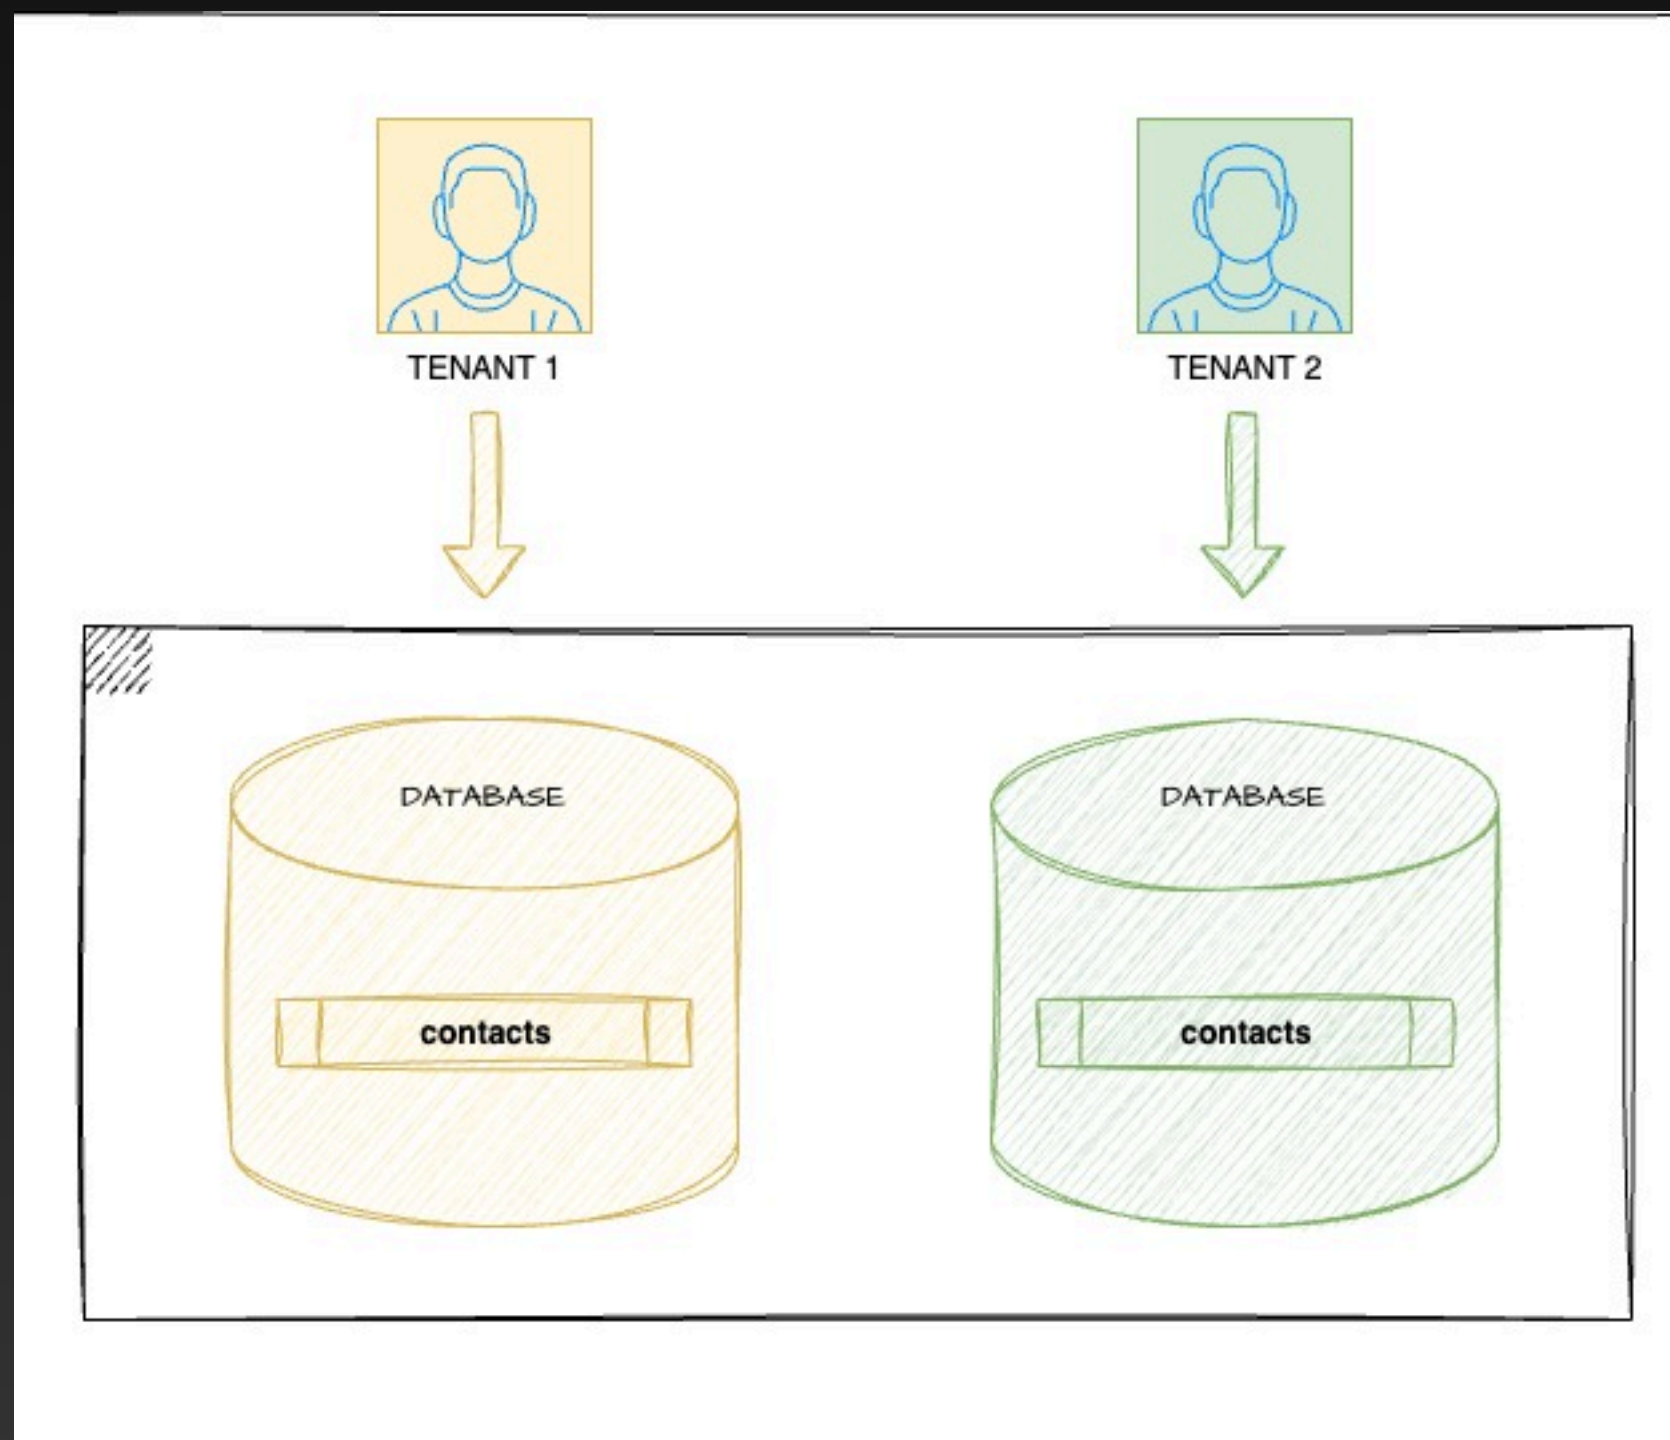

### Cons

- More complex than shared schema
- Schema management still needs careful planning
- Potential for cross-schema issues if not managed well

# Separate databases

## Multi-tenancy Approaches

### Pros:

- Strongest data isolation
- Tenant-specific customization possible
- Enhanced security
- Performance isolation

### Cons

- Highest cost
- Most complex to manage
- Resource intensive
- More overhead for tenant onboarding and management

# Implementing Multi-Tenancy in Your Laravel Applications

## Laravel Packages

- <https://spatie.be/docs/laravel-multitenancy/v4/introduction>
- <https://tenancyforlaravel.com/>

# Laravel-multitenancy (Spatie)

This package can be installed via composer:

```
composer require "spatie/laravel-multitenancy:^4.0"
```

# Laravel-multitenancy (Spatie)

You must publish the config file:

```
1 php artisan vendor:publish --provider="Spatie\Multitenancy\MultitenancyServiceProvider" --tag="multitenancy-config"
```
